## Introduction of CA-modules CI+ for Cryptoguard encryption system

Friday 13 January 2012

**Cryptoguard** and **SMiT** have together developed Cryptoguard CI+ SECURE PLUS CAM. The module meets the safety demands HD-content providers require.

SECURE PLUS CAM is fully compatible with CI Plus specification V 1.2 standard.

**Kjell Carlswård**, CEO Cryptoguard says; *"Program provider feel that today's DVB Common Interface (CI) standard, where the content between the CI-module and TV, don't provide the necessary level of safety for HD-content. As part of the evolution of technology Cryptoguard has now developed CI+ CAM with SMiT"*.

CI+ module implements a form of copy protection between a Conditional Access Module (CAM) and a TV. CI+ module is backward compatible with older TV sets that do not have CI+ support, but then works only with the functions that do not require CI+ functions.

### **A professional CA-module**

There is now also a professional version of the CA module that handles the decoding of up to eight concurrent services without compromising on safety.
